Nucleic acid characteristic of late or early passage cells immortalised by papilloma virus - and related polypeptide(s) and antibodies, used for diagnosis and treatment of cervical cancer and assessing potential for progression of cervical lesions.

Claim 2; Fig 1; Bpp; German.

This sequence, C4.8, is derived from a human papillomavirus (HPV) immortalised human foreskin keratinocyte cell line HPK-1A and is characteristic of late or early passage cells. This sequence is used in a method for assessing the potential for progression of cervical lesions. Antibodies generated against the encoded polypeptide are used for diagnosis of cervical cancer and to assess potential for lesion

```
progression. Antibodies can also be used therapeutically by inhibiting the polypeptide. Antisense molecules based on the nucleoride sequence are used to inhibit expression of the protein. Detecting polypeptides, or related RNA, characteristic of late passage cells (which are potentially malignant) in cervical smears is a reliable way of assessing progression
                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                       120

Sequences AAF93180 - AAF93743 represent polynucleotide sequences encoding human SRT proteins. The CDNA sequences are isolated from various fiferent human tissue CDNA libraries. The invention relates to a method for detecting cDNA encoding an SRT protein, a vector containing CDNA encoding SRT, a host cell transformed with the vector, an isolated SRT

                                                                                                                                                                                                                         61
polypeptide, and an antibody which binds to SRT. The polynucleotide sequence can be used in gene therapy and is useful in the recombinant production of SRT polypeptides as a hybridisation probe to screen libraries to isolate cDNAs with sequence identity to SRT polypeptides, the map the gene encoding the SRT polypeptides and analysing genetic disorders, tissue typing and disease tissue detection. The SRT polypeptides polynucleotide sequences can be used in polymerase chain reaction, screening for new therapeutic molecules and generation of antisense RNA

The present invention describes colon tumour associated proteins (I) and the polynucleotides (II) that encode them. (I) have cytostatic activity. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) and be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) corpression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying. (II) must be used to treat disorders associated with decreased expression by rectifying or to treat disorders associated with decreased expression by rectifying or TCAPE by expressing inactive proteins or to supplement the patients own production of them. Additionally, (II) may be used to produce the TCAP production of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the nucleic acids into a host cell culturing the calls to be used as DNA probes in diagnostic polymerase chain reaction (PCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of the castoriative therapy. (I) may also be used as antigens in the production of antibodies against TCAPE and in assays to identify modulators of TCAP expression and activity. Anti-(I) antibodies and antagonists may also be used as diagnostic agents for detecting the antibodies may also be used as diagnostic agents for detecting the considered and amino acid sequences given in the exemplification of the reconstruction of the exemplification of the exemplification of the exemples of the production of the exemple of the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        396
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TIGICAACGIGGGCIACTICCICAICGCAGCCGGCGIIGIGGICIIIIGCICTIGGIITICC 121

Also described: (1) a method for detecting the presence of cancer in a patient; (2) a method for stimulating and/or expanding T cells specific for a tumour protein; (3) an isolated T cell population comprising T cells prepared by the method of (2); (4) a method for stimulating an immune response in a patient; (5) a method for treating cancer in a patient; and (6) a method for inhibiting the development of cancer in a patient. (1) have immunostimulant and cytostatic activities and can be used in vaccines. AB232646 to AB233725 and ABP55391 represent human colon cancer/tumour related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              396

The invention relates to an isolated polynucleotide (I) encoding a polypeptide (II) comprising a portion of a colon tumour protein. A new polypeptide (III) that hybridises to (I) is useful for determining the presence of a cancer in a patient. (II) or antigen presenting cells expressing (I) are useful for stimulating and/or expanding T cells so that capress (II). (II) or antigen presenting cells that express (II). (I). (II), or antigen presenting cells that express (II). (II), or antigen presenting cells that express (II) are useful for treating colon cancer in a patient by incubating CD4+ and/or CD8+ T cells that express (II), or patient with (I), (II), or antigen presenting cells that express (III) as patient with (I), (II), or and administering to the patient an effective cancer in the patient. A new composition is useful for stimulating an immune response in a patient. (I) or (II) is useful for stimulating an immune response in a patient. (I) or (II) is useful in vaccines and antibody against (III) is useful for detection, diagnosis and/ or therapy of human colon and in the design and preparation of ribozyme captured for inhibiting expression of (II) in tumour cells. ARX29475- the formal or and in the design and preparation of ribozyme captured for inhibiting expression of (II) in tumour cells. ARX29475- the formal colon adenocarcinoma-specific cDNA sequences of

```
This is the nucleotide sequence of the human tumour-associated antigen

(PRAT) used in the method of the invention for stimulating cell

proliferation and screening for antegonists useful to treat or prevent

cell proliferation disorders such as cancer, and genetic defect e.g.

sickle cell anaemia. The polypeptides can be combined with a suitable

carrier in pharmaceutical compositions, and also used to screen for

antagonists, agonists, and to generate antibodies. PRAT agonists can be

carrier in pharmaceutical compositions, which can be

added to a cell to stimulate cell proliferation by increasing or

prolonging the activity of PRAT as above. The antagonists can be combined

with a suitable carrier in pharmaceutical compositions, which can be

administered to subjects to treat or prevent disorders associated with

cell proliferation, especially cancers. Antibodies specific for PRAT may

be used directly as antagonists, or indirectly as a targeting or delivery

mechanism to bring pharmaceutical agents to PRAT-expressing cells. They

expression and to monitor therapeutic interventions. The polynucleotide

chyptidisation probes, useful to detect polynucleotides or fragments

encoding PRAT, or complementary sequences, can be used to produce

chyptidisation probes, useful to detect polynucleotides or fragments

encoding PRAT, e.g. to diagnose diseases relating to polypeptide

expression or monitor PRAT regulation during therapeutic intervention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                          The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a prostate cancer by comparing the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal control non-prostate cancer.

Nucleic acids of the invention as afflicted with prostate cancer.

Nucleic acids of the invention as elected in gene therapy. Sequences given in ADB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence cata for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.

The invention relates to a method of classifying a breast cancer patient excording to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  241

New nucleic acids, and encoded proteins, from prostatic cancer tissue, useful for diagnosis, treatment and in screening for specific binding Claim 1; Page 268; 1607pp; German.

This invention describes novel cytostatic polynuclectide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences in constraints over transcription or inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonuclectides, short-interfering RNA or ribozymes; an organic molecule of molecular catamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polypuclectides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays. Detween normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated concerpational antibody; streptavidin-conjugated horseradish percond antibody; streptavidin-conjugated horseradish perconds antibody; streptavidin-conjugated horseradish perconds antibody; streptavidin-conjugated horseradish perconds antibody; streptavidin-conjugated horseradish camples were counterstained which hemalum (blue). Mallagnant cells stained curronly but non-malignant cells only weakly. In 15 of 6 samples of proventide and nolwornide sequences used in the percondence of the polyment of the percondence of the percondence of the percondence of the percondence of t polynucleotide and polypeptide sequences used in the method of the invention.

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Cor the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection core substances involves a blinding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of trumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular veright below 5000, preferably 300, that binds to the polypeptide; an expaner against the polypeptide, a (monoclonal) antibody (Ab) against the collypeptide, preferably humanised or human; an anti-idiotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised of the reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, concer by differential expression analysis, using DNA microarrays, by quantitative POR. Manalysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated

sequentially with anti-human CD4 murine monoclonal antibodies; botinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65905-ADR65954 represent the polymucleotide and polypeptide sequences used in the method of the

The present invention describes an isolated tumour-associated antigenic target (TTT) mucleic acid comprising: (a) any of 4522 nucleotide sequences (see SEQ ID NO:1 to 4622); (b) the full-length coding region of (a); (c) the complement of (a) or (b); (d) a sequence that has 80% of sequence identity to (a)-(c); or (b) a sequence that hybridises to (a)-(c). Also described: (1) an expression vector comprising the above expression vector; (3) a process for producing a polypeptide; (4) an isolated polypeptide; (6) an isolated polypeptide; (a) an amino acid sequence encoded by any of the above comprising the above polypeptide; (b) a chimaric polypeptide comprising the above polypeptide full sequence encoded by any of the above comprising the above polypeptide full sequence encoded by any of the above comprising the above polypeptide full sequence antibody that binds to the above polypeptide; (6) a chimaric polypeptide; (6) an isolated antibody that binds to the above polypeptide; (1) a process of for producing the antibody; (8) an isolated oligopeptide that binds to the above polypeptide; (1) a comprising the above polypeptide or TAT binding organic molecule that binds to the above polypeptide; (10) a composition of matter comprising the above (chimeric) polypeptide; (1) an article of manufacture comprising a container; of the growth of matter companies within the container; (12) methods of the protein; unding the protein; unding the protein; unding the protein; unding the protein; (11) an article of manufacture comprising the above protein; of a cell that expresses the above protein; (13) a method of determining the protein; of the apove protein; (13) a method of described above; (15) methods of diagnosing the presence of a protein in a sample suspected of containing the protein; and (17) a method of binding an artibody, oligopeptide to a cell that expresses the above protein; and containing the protein; and (17) a method of binding an artibody, oligopeptide to a cell that expression or activity of the above protein; ö preventing or treating cancer. The composition is also used for preparing a medicament for the therapeutic treatment or diagnostic detection of a cell proliferative disorder or cancer. Disclosure; Page 444-445; 481pp; English

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression of the marker in a patient sample and the normal level of expression of the marker in a patient sample and the normal level of expression of the marker in selected from 363 cancer markers described in the comparing the marker is selected from 363 cancer markers described in the constraint or selected from 163 cancer. The method may also be of characterising cancer, in detecting the presence of cancer as early as particular use with patients having an enhanced risk of developing covarian cancer (e.g. patients having an enhanced risk of developing covarian and central nervous system disorders (e.g. brain et.g. barcerial ocdema, hydrocephalus or brain herniations), conficular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart cused in assessing the histological type of neoplasm associated with covarian cancer, monitoring the progression of ovarian cancer, determining coloring and methods may also be coloring and methods may also be conserved to the season of the coloring of coloring and methods was entered to the coloring the progression of ovarian cancer, determining coloring and methods may also be coloring and methods may also be coloring the progression of ovarian cancer, menitoring the progression of ovarian cancer and the coloring the progre selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present nucleic acid invention

Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invantion involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in

The invention relates to nucleic acids and proteins (ADN38683-ADN40064) whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention or by detecting a polypeptide of the invention or by detecting a polypeptide of the invention, use of such antibodies for drug targeting; an uncleic acid of the invention; antibodies which specifically bind a polypeptide of fereening for medulators of earthing; and methods of screening for medulators of earthing; and nucleic acids. The nucleic acids, polypeptides, and nucleic acids are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, attended also be useful in wound healing and in contracetion. The present

//note="Organ: Stomach; Vector: pCNS; Site_l: EcoRI;
Site_2: Noti; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The GT-tailed vector was adjusted to have about 60nt. The CDNA vector was circularized with B. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Toplof* by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."

/site 2: Not1; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intect mRNA was ligated with DNA-RNA linker including EGOR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with B. coll DNA ligase after digestion of ECONI which site is also included in vector. An RNA strand converted to a DNA strand by Okayam-Berg method. The

/inote="Organ: Stomach; Vector: pCNS; Site_1: EcoRI;
Site_2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand CDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which strend by Okayama-Berg method. The converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of converted coll Toplof* by electroporation method. The cDNA libraries constructed by this method are full-length enriched CDNA library."

//site_2: Not1; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including ECOR I site by treatment of T4 RNA ligase and the first strand cDNA was synthhesized from oligo dT-selected mRNA by priming with dT-tailed vector. The CT-tailed vector was adjusted to have about 60nt. The CDNA vector was circularized with E. coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of convertent cells E. coli Toplof' by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."
